

Tuberculosis (TB) Testing General Information

The THD's community-wide Tuberculosis Prevention Program utilizes education, testing and TB treatment to help stop the spread of Tuberculosis.

What is TB?

TB is caused by bacteria that usually attacks the lungs. It is spread through the air from person to person. TB usually affects the lungs, but it can also affect other parts of the body, such as the brain, the kidneys, or the spine. A person with active TB disease can die if they do not get treatment.

You may fall into a [high- or moderate-risk group](#) for TB if you have an HIV infection, have had recent contact with a person with active TB disease, or if you have recently been in a country with a high incidence of TB.

Services

Services	Cost	Additional Information
